

When the specific insulation material make and manufacturer is unknown, we'll use these generic R-values per inch to determine original R-values for a project.

MATERIAL		(R/INCH)
<b>Batt or blanket type insulation</b>		
<b>Glass fibre</b>	<ul style="list-style-type: none"> <li>Composed of long fibres of spun glass loosely woven together and bonded with resin</li> <li>Batts 3.5" thick = R-12</li> <li>Batts 5.5" to 6" thick = R-20</li> </ul>	
<b>Mineral fibre (rock/stone wool)</b>	<ul style="list-style-type: none"> <li>Made from natural rock which is melted, made into fibres, and bonded</li> <li>Batts 3.5" thick = R-12</li> <li>Batts 5.5" to 6" thick = R-20</li> </ul>	
<b>Loose fill insulation</b>		
<b>Cellulose fibre</b>	Manufactured from finely shredded newsprint with chemicals mixed in to resist fire and fungal growth	(3.6)
<b>Glass fibre</b>	Similar material to glass fibre batts but chopped up for blowing purposes	(2.7)
<b>Vermiculite</b>	<ul style="list-style-type: none"> <li>Mica material that has been expanded by a high temperature steam process;</li> <li>Light brown/grey/gold in colour and is a pebble-like material ranging in size from 2 to 10 millimetres in diameter</li> <li>Vermiculite installed prior to 1990 is likely to contain asbestos</li> </ul> <p>Note: Existing vermiculite should be handled with care. For more details on vermiculite insulation, check out the Safe Manitoba bulletin available from Manitoba Workplace Safety and Health or online at <a href="https://safemanitoba.com/Resources/Pages/bulletin-245.aspx">safemanitoba.com/Resources/Pages/bulletin-245.aspx</a>.</p>	(2.2)
<b>Wood shavings</b>	By-product of wood industries; shavings are often mixed with lime and other chemicals	(2.2)
<b>Rigid board insulation</b>		
<b>Expanded polystyrene ("beadboard" or "EPS")</b>	<b>Type 1 &amp; 2</b> Produced by a process that results in beads containing air, bonded together into rigid, foam plastic boards	Low density (3.75) High density (4.1)
<b>Extruded polystyrene ("XPS")</b>	<b>Type 3 &amp; 4</b> A foam plastic board composed of fine, closed cells containing a mixture of air and other blowing agent gases (such as fluorocarbons including HFCs and HFOs)	(5.08)
<b>Polyisocyanurate boards</b>	<ul style="list-style-type: none"> <li>A foam plastic board with primarily closed cells filled with air and other blowing agent gases (such as hydrocarbons including pentane blends)</li> <li>Foil faced products typically benefit from improved thermal resistance, reduced water, vapour and gas permeability and enhanced structural stability</li> </ul>	(5.7)
<b>Spray/blow in place insulation</b>		
<b>Spray polyurethane foam</b>	<ul style="list-style-type: none"> <li>A semi-flexible plastic foam manufactured on site using two liquid components</li> <li>Liquid components are mixed in a specific ratio and spray applied where they cure in place through a chemical reaction</li> </ul>	Medium density (5.19)
<b>Cellulose</b>	<ul style="list-style-type: none"> <li>Made from paper or paper board stock with chemical additives for fire and fungal resistance</li> <li>It can be spray applied with water to form a cohesive mat on surfaces, but is more typically blown into attic spaces or wall cavities</li> </ul>	(3.5)
<b>Glass fibre</b>	<ul style="list-style-type: none"> <li>Loose, glass fibre insulation, incorporating a water-activated adhesive</li> <li>The dry insulation is misted with water and installed using a blowing machine</li> </ul>	(3.6)

The R-values per inch listed in this chart are in imperial units, °F·ft<sup>2</sup>·h/Btu. These values are aligned with the National Building Code 2020 (NBC 2020) Table A-9.36.2.4.(1)-D. Generic material thermal resistance values listed in that table but not listed here are also accepted.
